RESEARCH FIELDS Macroeconomics, Monetary Economics

WORKING PAPERS "Labor Market Recoveries Across the Wealth Distribution"

Job Market Paper

This paper studies why, after the onset of recessions, low-wealth workers experience larger falls and slower recoveries in earnings than high-wealth workers. I show that differences in job-switching and job-losing rates play an important role in explaining these dynamics. To do so, I build a quantitative search and matching model with incomplete markets and on-the-job search in which wages are determined by an alternating offer bargaining protocol that, unlike traditional settings, accommodates risk-averse workers and wealth accumulation. The wages of job-switchers result either from Bertrand-competition between firms or, if the poaching firm is sufficiently more productive than the incumbent, from one-on-one negotiation between poacher and worker. This model includes an ingredient I document empirically: over the first fifteen months following a job switch workers experience a 6.4 percentage point increase in their job-loss probability. Through this model I conclude that cyclical differences in job-switching and job-losing by wealth, which the model can endogenously reproduce, explain 40 percent of the gap in earnings recovery between low- and high-wealth workers following the Great Recession. I then apply the model to study the post-Pandemic behavior of job-switching and show that fiscal stimulus alleviated its fall and sustained its recovery.

"Optimal Monetary Policy with Menu Costs is Nominal Wage Targeting" with Basil Halperin

We show analytically that ensuring stable nominal wage growth is optimal monetary policy in a multisector economy with menu costs. This nominal wage targeting contrasts with inflation targeting, the optimal policy prescribed by the textbook New Keynesian model in which firms are permitted to adjust their prices only randomly and exogenously. The intuition is that stabilizing nominal wages minimizes the number of firms which need to adjust their prices, and therefore minimizes the resources wasted on menu costs. We show that the analytical result that nominal wage targeting is superior to inflation targeting carries over in a rich quantitative model.
